Freestyle Libre

Effect of Flash Glucose Monitoring on Glycemic Control, Hypoglycemia, Diabetes-Related Distress, and Resource Utilization in the Association of British Clinical Diabetologists (ABCD) Nationwide Audit

Harshal Deshmukh,¹ Emma G. Wilmot,² Robert Gregory,³ Dennis Barnes,⁴ Parth Narendran,⁵ Simon Saunders,⁶ Niall Furlong,⁷ Shafie Kamaruddin,⁸ Rumaisa Banatwalla,⁹ Roselle Herring,¹⁰ Anne Kilvert,¹¹ Jane Patmore,¹ Chris Walton,¹ Robert E.J. Ryder,¹² and Thozhukat Sathyapalan¹

East and North Herts Institute of
Diabetes and Endocrinology

The FreeStyle Libre system is associated with significantly improved glycaemic control as measured by HbA1c

Predictors of HbA1c reduction:

- Higher baseline HbA1c
- A greater number of scans per day

Mean daily scans

12.9 per day

East and North Herts Institute of
Diabetes and Endocrinology

The FreeStyle Libre system users had significantly less paramedic call outs, hospital admissions and episodes of severe hypoglycaemia in the 7.5 month follow up period

Comparison is made 12 months prior to FreeStyle Libre initiation to 7.5 months post

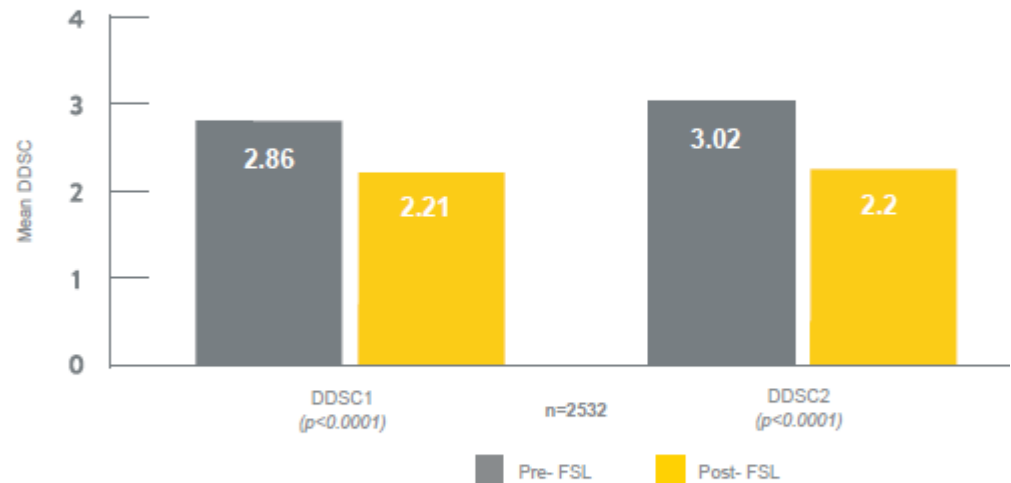

*those events requiring third party assistance

NHS RESOURCE UTILISATION REDUCTION SEEN ACROSS ALL MEASURES

East and North Herts Institute of
Diabetes and Endocrinology

The FreeStyle Libre system is associated with a significantly improved diabetes distress score

Mean Diabetes Distress Score Pre and Post-FreeStyle Libre

	Not a Problem	A Slight Problem	A Moderate Problem	Somewhat Serious Problem	A Serious Problem	A Very Serious Problem
1. Feeling overwhelmed by the demands of living with diabetes.	1	2	3	4	5	6
2. Feeling that I am often falling with my diabetes routine.	1	2	3	4	5	6

IMPROVEMENTS IN BOTH COMPONENTS OF DIABETES DISTRESS WERE REPORTED

East and North Herts Institute of
Diabetes and Endocrinology

The FreeStyle Libre system is associated with significantly improved hypoglycaemic awareness and reductions in patient reported hypoglycaemia

Gold Questionnaire

“Do you know when your hypos are commencing?”

A score of 4 or greater suggests impaired awareness

n=2801

Reduced from 2.7 to 2.4 ($p < 0.0001$)

53% of those with a score ≥ 4 at baseline had a score < 4 at follow up

of users able to reduce rate of hypoglycaemia

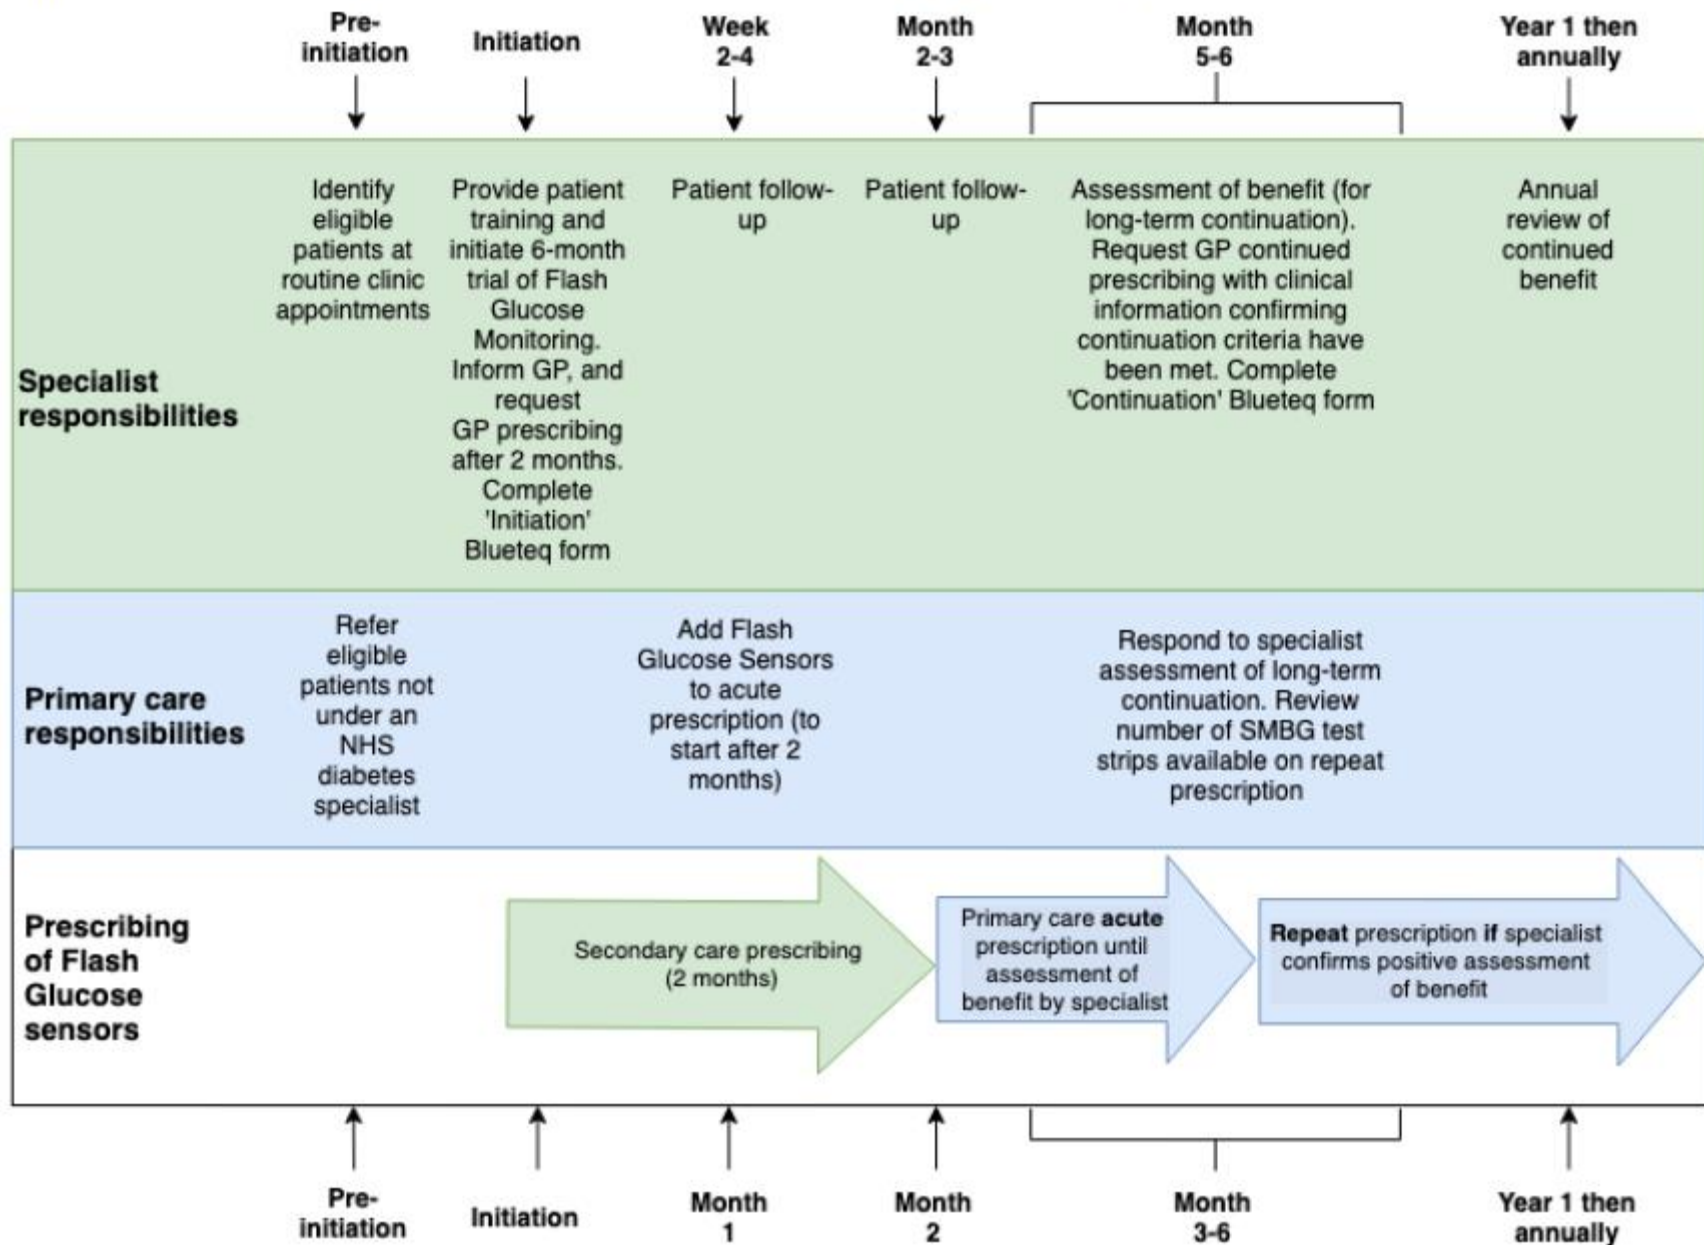

of users able to reduce proportion of time in hypoglycaemia

of users able to reduce rate of nocturnal hypoglycaemia

- Eligibility Criteria (CCG)
 - Type 1 diabetes needing to test > 8 x per day
 - Any diabetes on HD needing to test >8 x per day
 - Diabetes associated with CF and on insulin treatment
 - Type 1 diabetes and pregnant (12m funding)
 - Type 1 diabetes unable to self monitor due to disability
 - Type 1 diabetes & occupation
 - Psychosocial
 - Previous self funder who would meet current criteria for Libre AND has shown HbA1c improvement
 - Type 1 and impaired awareness of hypoglycaemia
 - Type 1 diabetes or insulin treated Type 2 diabetes living with a learning disability

Appendix 2 - Summary of process for initiation and supply of FreeStyle Libre/Libre 2®

Time in range

REVIEW ARTICLE

Time in range: A best practice guide for UK diabetes healthcare professionals in the context of the COVID-19 global pandemic

**E. G. Wilmot^{1,2}  | A. Lumb^{3,4}  | P. Hammond⁵ | H. R. Murphy^{6,7}  | E. Scott⁸ |
F. W. Gibb^{9,10}  | J. Platts¹¹ | P. Choudhary^{12,13} **

TABLE 1 Objective measures of glycaemic control derived from real-time continuous glucose monitoring (CGM) and intermittently scanned CGM data

Metric	What does it measure?
Percentage of sensor data captured	Proportion of possible readings captured by the rtCGM or isCGM device. Provides a measure of confidence in the other data-derived outcomes.
TIR measures	
TIR	Percentage of time spent in the target glucose range set on the rtCGM or isCGM system: defined as 3.9–10.0 mmol/l.
TBR	Percentage of time spent below the target glucose range set on the rtCGM or isCGM system: defined as below 3.9 mmol/l.
TAR	Percentage of time spent above the target glucose range set on the rtCGM or isCGM system: defined as above 10.0 mmol/l.
eA _{1c} /GMI	Short-term glucose exposure that can be used in conjunction with long-term HbA _{1c} in setting goals.
Mean glucose	Average glucose level calculated across the recorded glucose readings over a defined period.
Standard deviation	Variability (highly influenced by mean glucose).
CV	Variability that is less influenced by mean glucose. Expressed as %CV, calculated as $100 \times (\text{sd}/\text{mean glucose})$

East and North Herts Institute of
Diabetes and Endocrinology

* Readings >13.9 mmol/l are also included in the <25% target
Readings <3.0 mmol/l are also included in the <4% target

Thinking about individualised targets

A person with HbA1c of 53-63 mmol/mol (7.0-7.9%) will see on average a 4 mmol/mol (0.4%) reduction with each 10% (2 h 24 min) increase in TIR

A person with HbA1c of ≥64 mmol/mol (≥ 8.0%) can see on average a 11 mmol/mol (1.0%) reduction in HbA1c with each 10% (2 h 24 min) increase in TIR

A 10% (2 h 24 min) decrease in TAR can be associated on average with a reduction in HbA1c of approx 7 mmol/mol (0.6%)

For age <25 years with type 1 diabetes, if the HbA1c goal is 58 mmol/mol (7.5%), set TIR target to approx 60%

FIGURE 1 Time in ranges: targets for people with type 1 or type 2 diabetes. TAR, time above range; TIR, time in range

Time in Range: targets for older people and those at high-risk of hypoglycaemia

* Readings >13.9 mmol/L are also included in the <50% target

Thinking about individualised targets

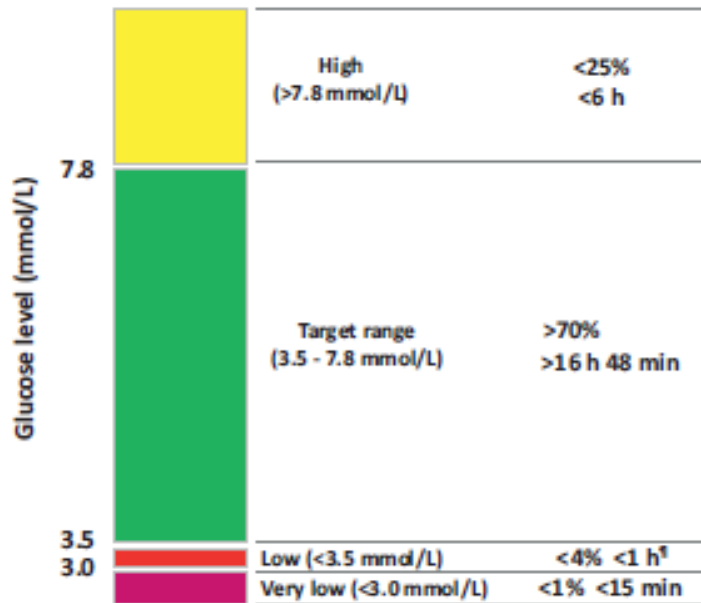

Emphasise the need to prioritise hypoglycaemia avoidance, reducing the STBR <3.9 mmol/L

Recommendation is to keep %TBR <3.9 mmol/L to <1% or 15 min per day

FIGURE 3 Time in ranges: targets for older people with type 1 or type 2 diabetes and those at high risk from hypoglycaemia. TBR, time below range

Time in Range: targets for women with type 1 diabetes who are pregnant*

Thinking about individualised targets

Women with T1D should aim for a daily TIR of >70% (16 h 48 min) from as early as possible during pregnancy

Women with T1D should aim for a daily TAR >7.8 mmol/L of <25% (<6 h), from as early as possible during pregnancy

A 5% (1 h 12 min) increase in TIR during the 2nd and early 3rd trimester is associated with clinically relevant improvements in neonatal health

During pregnancy the %TIR should be considered in conjunction with mean daily glucose, aiming for a mean glucose of 6.0 - 6.5 mmol/L

* %TIR, %TBR and %TAR are based on limited evidence. More research is needed.

† Readings <3.0 mmol/L are also included in the <4% target

FIGURE 4 Time in ranges: targets for women with type 1 diabetes who are pregnant or planning pregnancy. TAR, time above range; TBR, time below range; TIR, time in range

EVERY 10% increase in TIR

REDUCED RISK

TIR, %	Predicted HbA _{1c} [†]	
	mmol/mol	%
90	42 (28, 56)	6.0 (4.7, 7.3)
80	48 (33, 62)	6.5 (5.2, 7.8)
70	53 (38, 67)	7.0 (5.6, 8.3)
60	57 (43, 73)	7.4 (6.1, 8.8)
50	63 (49, 77)	7.9 (6.6, 9.2)
40	68 (54, 83)	8.4 (7.1, 9.7)
30	74 (60, 88)	8.9 (7.6, 10.2)
20	78 (64, 93)	9.4 (8.0, 10.7)

Diabetes Care 2018;42:400–405; Lu J et al. *Diabetes Care* 2018;41:2370–2376

- Strengths

- Dynamic
- Easy to track
- Can be visualised
- Can be personalised
- Directly actionable in real time
- Allows goal setting

- Considerations

- It's a new way of thinking, we don't have the correlations with complications
- Should be used together with other measures in making treatment decisions
- Improving %TIR (like HbA1c) should not be at the expense of %TBR

Libre View

The screenshot shows the LibreView software interface. At the top, there is a navigation bar with a mobile icon, a user icon, a search bar labeled 'Search Patients', and a plus icon. The 'LibreView' logo and a menu icon are on the right. The main content area has a blue background with the heading 'Upload a Device'. Below this, there are two numbered steps: 1. 'Connect the device to your computer with the correct cable' and 2. 'Choose upload option below'. A dark blue box contains the text: 'The LibreView Device Drivers software is required to upload a device. [Download the LibreView Device Drivers software](#)'. In the foreground, a hand holds a 'FreeStyle Libre' sensor. In the background, a computer monitor displays the LibreView software interface, which includes a line graph showing glucose trends over time, a scatter plot of individual glucose readings, and a table of data. At the bottom of the interface, there are two buttons: 'Create 1-Time Report' and 'Create Report Linked to Patient', separated by the text 'OR'.

Upload a Device

- 1 Connect the device to your computer with the correct cable
- 2 Choose upload option below

The LibreView Device Drivers software is required to upload a device. [Download the LibreView Device Drivers software](#)

Glucose Pattern Insights

31 August 2021 - 13 September 2021 (14 Days)

LibreView

GMI 7.3 % or 57 mmol/mol

Likelihood of LOW GLUCOSE	●	●	●	●	● OK
MEDIAN GLUCOSE Compared to goal	●	● OK	● OK	●	●
VARIABILITY BELOW MEDIAN Median to 10th percentile	●	●	●	●	●

VARIABILITY BELOW MEDIAN IS HIGH This makes it difficult to achieve the median glucose goal without increasing the likelihood of low glucose.

Factors that could contribute to variability below median:

- Erratic diet
- Variations in activity level
- Incorrect or missed medication
- Illness
- Alcohol consumption

Case 3

Snapshot

16 June 2021 - 13 September 2021 (90 Days)
